

Development Report — Formation Page Calculator

Date: 25 April 2026

Project: Application / Website — Formation Page

Prepared by: Islem

Work Completed

1. Calculator Integration in the Formation Page

Implemented the calculator directly inside the formation page so users can interact with it within the main learning or service flow.

- Added the calculator component to the formation page
 - Connected the calculator interface to the page structure
 - Verified that the calculator appears in the correct section
 - Started testing the user flow around the calculator
 - Ensured the feature is accessible from the main page layout
-

2. UI Review and Required Fixes

Several UI issues were identified during testing. The current implementation works functionally, but the interface still requires visual polishing before being considered complete.

The remaining UI work includes:

- Improving spacing between sections
 - Adjusting alignment of calculator elements
 - Reviewing mobile responsiveness
 - Fixing inconsistent padding and margins
 - Improving visual hierarchy
 - Making the calculator feel more integrated into the formation page
 - Reviewing buttons, inputs, and result display styling
 - Ensuring the page remains clean and professional on different screen sizes
-

3. PDF Functionality Investigation

PDF generation/export functionality is still being tested. The feature is currently unstable: in some cases, it works properly, while in other cases it breaks unexpectedly without a clear reason.

Current observations:

- PDF export sometimes works correctly
- The feature can fail randomly during testing
- The issue does not appear to be fully consistent

- Further debugging is required to identify whether the problem comes from rendering, timing, data formatting, or the PDF generation library
 - More tests are needed before confirming the feature as stable
-

4. Build Issue and Mobile Testing Blocker

A major issue was encountered during the development session: the application was not building correctly, which prevented testing on a physical phone.

This issue took a significant amount of time because the app could not be compiled and launched normally.

Impact:

- Could not immediately test the latest changes on mobile
 - Slowed down validation of the calculator integration
 - Delayed verification of responsive behavior
 - Required debugging before continuing mobile testing
-

Current Status

The calculator has been implemented in the formation page, but the feature is not yet fully finalized.

The main remaining work is:

- Complete UI fixes
 - Stabilize PDF functionality
 - Resolve or monitor build issues
 - Test the feature properly on a physical mobile device
 - Validate the full user flow from calculator usage to PDF export
-
